

C++ Data Types

Given three values of different data types. You are required to store these values in variables of corresponding data type and output them.

Input:

The only line of input contains three space separated values of different types.

Description of data types of the values:

- 1) First value will be of integer type.
- 2) Second value will be of character type.
- 3) Third value will be of type float.

Output:

Output three lines as described:

- 1) First line will contain first value.
- 2) Second line will contain second value
- 3) Third line will contain third value.

Example:

Input:

1 h 2.555

Output:

1

h

2.555
